Chat Workflow: Ask the Data

From the user's question to the answer on the page · the model never writes a number

USER MODEL decides or writes CODE checks or computes PAGE shows

1 Question — USER

Typed, or picked from the suggested questions.

▼

2 Plan tool calls — MODEL

Reads the question, the rules and the list of tools, measures and values. Returns tool calls as JSON, each with a one-line purpose.

`ai/prompts/chat.md · ai/prompt_input_chat.txt`

▼

3 Check each call — CODE

Known tool, measure, dimension and values only; required arguments present; no numbers typed in the purpose.

`core/tools.py`

◀ **Call rejected**
Not run. The reason is recorded and the answer is not shown.

▼

4 Run the calls on the data — CODE

Uses the same measure functions as the dashboard. Results become named values, e.g. c5_online_ty = 13%.

`core/tools.py · core/metrics.py`

▼

5 Write the answer — MODEL

Reads the named values. Writes a headline and sections using placeholders such as {c5_online_ty}, never digits. Labels each sentence as fact, interpretation, suggestion or limit.

▼

6 Check the answer — CODE

No typed numbers; every placeholder is one of this answer's results; words such as "rose" or "fell" match the direction; "from A to B" moves the stated way; every fact cites a value; data unchanged since the answer was written.

`core/brief.py`

◀ **Answer rejected**
Hidden with the reasons. Other answers are not affected.

▼

7 Fill in the values — CODE

Each placeholder is replaced with its value from the data. The calls, results and checks are kept as the evidence trace.

`build.py`

▼

8 Show the answer — PAGE

Shows the answer and an evidence trace: tool calls, results, the answer as written, values filled in, checks passed.

`dist/index.html`
