# Weekly Brief Workflow

From the week's data to the brief on the page · the model never writes a number · the stock brief follows the same steps

INPUT · MODEL writes · CODE computes or checks · PAGE shows

**1 Load the data** — INPUT

Sales lines for this year and last year, and weekly stock by product family.

`data/raw/TYLY_data_sample.xlsx`

▼

**2 Compute the measures** — CODE

Sales, customers and stock, compared with the same fiscal weeks and weekdays last year. Every breakdown must add back to its total.

`core/periods.py · core/metrics.py · core/inventory.py`

◀ **Totals do not match**
The build stops. No page is produced.

▼

**3 Scan for trends** — CODE

Fixed rules check every region, product family, store vs online, full-price vs outlet and customer group, alone and in pairs: streaks, speeding up or slowing down, moving against the total. Groups under 30 customers are left out.

`core/scan.py`

▼

**4 Pick the facts** — CODE

Named values the brief may cite, each with a format, a label and its source, e.g. genz_new_insider = 17%.

`core/facts.py`

▼

**5 Write the brief** — MODEL

Reads the writing rules and the facts. Writes the headline and four sections using placeholders such as {genz_new_insider}, never digits. Labels each sentence as fact or limit.

`ai/prompts/weekly_brief.md · ai/prompt_input.txt`

▼

**6 Check the brief** — CODE

No typed numbers; every placeholder is a known fact; words such as "rose" or "fell" match the direction; "from A to B" moves the stated way; every fact sentence cites a value; written for this week's data.

`core/brief.py`

◀ **Brief rejected**
Hidden with the reasons. The rest of the dashboard is shown.

▼

**7 Fill in the values** — CODE

Each placeholder is replaced with its value from the data. The brief is stored with its facts and the number of values checked.

`build.py`

▼

**8 Show the brief** — PAGE

Shows the headline and sections at the top of the dashboard. Hovering a number shows its label and source.

`dist/index.html`
